

# Hours of service regulations in road freight transport: an optimization-based international assessment

Thibaut Vidal

Seminar, Universidade Federal Fluminense,  
March 15<sup>th</sup>, 2013

# Context of this research

- Joint work with (scheduling aspect)

Asvin GOEL, *Jacobs University*, Bremen, Germany

and also: (routing aspect)

Teodor Gabriel CRAINIC, *Université de Québec à Montréal, Canada*

Michel GENDREAU, *Ecole Polytechnique, Montréal, Canada*

Christian PRINS, *Université de Technologie de Troyes, France*

(routing)

# Presentation outline

- ❑ **Assessing the impact of hours of service (HOS) regulations on the travelling distance, duration and risk.**
- ❑ I) First discuss on **optimization methods** for vehicle routing.
- ❑ II) Some preliminary computational experiments.
- ❑ III) Have an efficient method for **generating high-quality itineraries in presence of different regulations.**
- ❑ IV) **Compare** these itineraries **and simulate risk.**

# Vehicle routing problems

## ❑ Capacitated vehicle routing problem:

- **INPUT** :  $n$  customers, with locations & demands.  
All-pair distances. Homogeneous fleet of  $m$  capacitated vehicles located at a central depot.
- **OUTPUT** : Least-cost delivery routes (at most one route per vehicle) to service all customers.

- ❑ NP-Hard problem
- ❑ Exact resolution impracticable for most problem instances of interest ( $\geq 200$  customers).
- ❑ “Scopus” facts : 2007-2011 = 1258 articles with the key *vehicle routing*.
- ❑ Massive research effort on heuristics.

# Vehicle routing problems

## □ Capacitated vehicle routing problem:

- Combinatorial optimization problem, for a problem with  $n=100$  customers and a single vehicle, the number of possible solutions is:

$n! = 933262154439441526816992388562667004907159682643816$   
 $2146859296389521759999322991560894146397615651828625369$   
 $7920827223758251185210916864000000000000000000000000000000 \approx 10^{158}$

- Even with a grid of computers which...

Contains as many CPU as the estimated nb atoms in the Universe :  $n_{CPU} = 10^{80}$

Does one operation per Planck time :  $t_p = 5.39 \times 10^{-44}$  s

We need  $T = 10^{158} \times 5.39 \times 10^{-44} / 10^{80} = 5.39 \times 10^{34}$  s to enumerate all solutions.

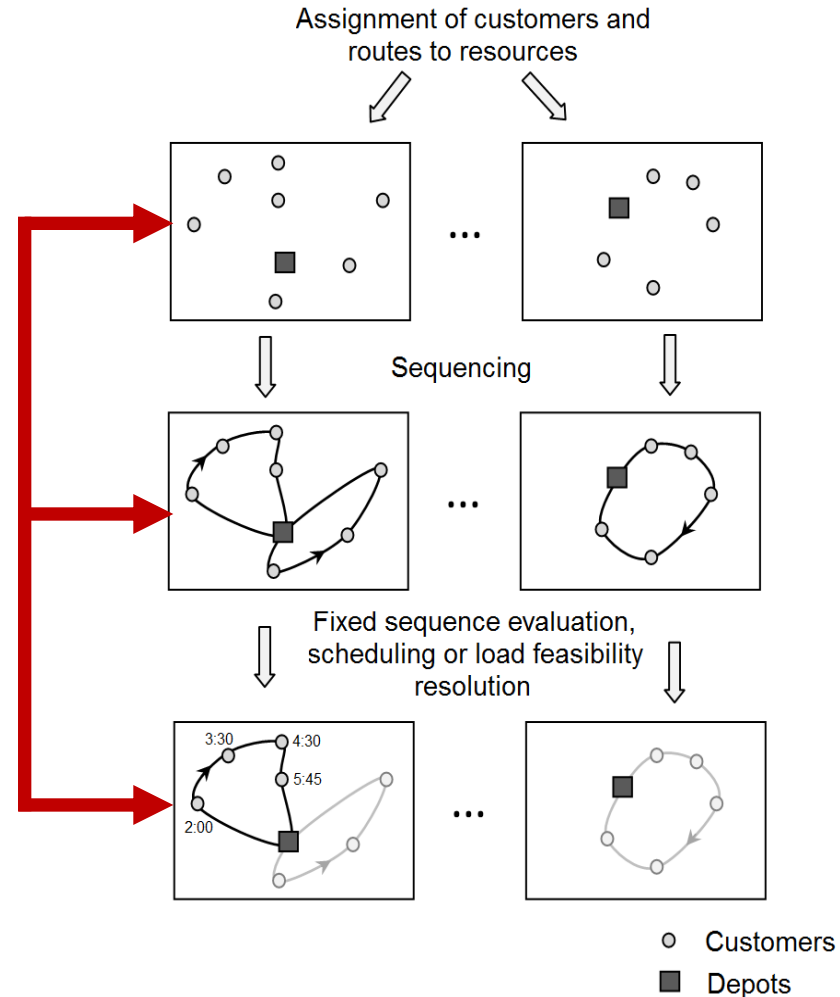

Compare this to the estimated age of Universe :  $4.33 \times 10^{17}$  s ...

# Vehicle routing problems

- ❑ **Vehicle routing “attributes”** : *Supplementary decisions, constraints and objectives which complement the problem formulations*
  - Modeling the specificities of application cases, customers requirements, network and vehicle specificities, operators abilities...
  - E.g. Time windows, Multiple periods, multiple depots, heterogeneous fleet, 2D-3D loading, time-dependent travel times...
  
- ❑ Multi-Attribute Vehicle Routing Problems (MAVRP)
  - Challenges : **VARIETY** of attributes
  - Challenges : **COMBINATION** of attributes
  - Plethora of attribute-specific methods in the literature, but no unified approach.

# Optimization methods for VRPs

- **ASSIGNMENT:** assignment customers and routes to days and depots
  - Take into account  
**Periodic, Multi-Depot, Heterogeneous Fleet** problems
- **SEQUENCING:** create the sequence of visits to customers
- **ROUTE EVALUATION:** Evaluate each route generated during the search
  - Time windows, Time-dep. travel time, Loading constraints, HOS regulations  
Lunch breaks, Load-Dependent costs...

# Unified genetic search with advanced diversity control

General HGA Methodology :

**Evolve a population of solutions with genetic operators : selection, crossover and mutation.**

**Simulate a survival-of-the-fittest scheme to achieve high-quality solutions.**

- ❑ Unified genetic search with Advanced Diversity Control (HGSADC):
  - Solution Representation *without trip delimiters* (Prins 2004)
  - High-performance local search-based *Education* procedure
  - Management of penalized infeasible solutions in two subpopulations
  - **Diversity & Cost objective for individuals evaluations**

# Unified genetic search with advanced diversity control

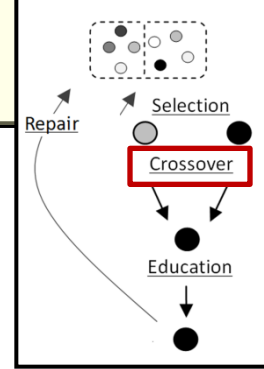

- Solution Representation, *without trip delimiters*, (Prins 2004), one giant tour per (depot/day):

- A polynomial “Split” algorithm based on a shortest path can be used to obtain the trip delimiters.

# Unified genetic search with advanced diversity control

- ❑ Selection by binary tournament.
- ❑ New periodic crossover with insertions : inherits customer-to-day assignments and subsequences from the two parents.

# Unified genetic search with advanced diversity control

## Education replaces mutation

- Two-level local search:
  - Route-improvement (RI) : insert, swap, 2-opt, 2-opt\* for each (day, depot) separately.

2-opt

Or-exchange

2-opt\*

CROSS

- Pattern-improvement (PI) : changing customer-to-days assignments.
- Called in Sequence PI-RI-PI

# Unified genetic search with advanced diversity control

- Speed-up techniques and memories
  - Granular search (Toth and Vigo 2003): Testing only moves in RI involving correlated nodes (X% close in terms of distance)
  - Memories for moves and for insertion costs in any route.
  
- **Repair** = Increase penalties and use education

# Unified genetic search with advanced diversity control

- ❑ The effect of route-constraints relaxations (load and duration) during local search...
- ❑ Helps transitioning between structurally different feasible solutions:

- ❑ Adaptation of penalty coefficients.

# Unified genetic search with advanced diversity control

- ❑ **Biased Fitness** is a tradeoff between ranks in terms of **penalized cost**  $fit(I)$ , and **contribution to the diversity**  $dc(I)$ , measured as a distance to others individuals.

$$BF(I) = fit(I) + \left(1 - \frac{nbElit}{nbIndiv - 1}\right) \times dc(I)$$

- ❑ Used during selection of the parents
  - Balancing strength with innovation during reproduction, and thus favoring exploration of the search space.
- ❑ and during selection of survivors:
  - Removing the individual  $I$  with worst  $BF(I)$  also guarantees some elitism in terms of solution quality.

# Computational Experiments on VRP instances

- ❑ Extensive computational experiments on 26 structurally different VRP variants and 39 sets of benchmark instances.
  - A total of 1008 problem instances.
- ❑ Comparing UHGS with the best problem-tailored method for each benchmark and problem. 10 runs on each problem.
- ❑ In the following, we indicate for each method
  - % Gap to the best known solution (BKS) of an average run (out of 10 for UHGS).
  - % Gap to the BKS of a best run (out of 10 for UHGS).
  - Computational effort (total work time) for an average run
  - Type of processor used.

# Computational Experiments on VRP instances

- ❑ **Matching or outperforming the current best 180 problem-dedicated algorithms from the literature for 29 problems and 38 benchmark instance sets !!!**
- ❑ BKS has been found or improved on 954/1008 problems
- ❑ Strictly improved on 550/1008 problems.
- ❑ All known optimal solutions have been retrieved !!
- ❑ Run time of a few minutes for average-size instances ( $n = 200-300$ )
- ❑ Standard deviation below 0.1%
- ❑ **Suitable as an optimization method to generate routes for our HOS regulations assessment.**

# Thank you for your attention !

# Hours of Service Regulations in Road Transport

## Fatigue

Truck driver fatigue is internationally recognised as a significant factor in 15-20% of all commercial road transport crashes

To improve road safety governments world wide are adopting stricter hours of service regulations for truck drivers

Some regulations introduce a "chain of responsibility" so that dispatchers can be made liable for unrealistic schedules

## Truck Driver Scheduling

**Problem:**  
Given a sequence of customer locations to be visited within given time windows, find a schedule complying with applicable hours of service regulations such that each customer is visited within the respective time window

## Regulatory Impact Analysis

- We assume that carrier seeks to minimise total costs
- Optimise routes for different regulations using hybrid genetic search
- Analyse solutions regarding total costs and road safety
- Fatigue/Risk Index Calculator provided by Health and Safety Executive - UK (<http://www.hse.gov.uk/research/rrhtm/rr446.htm>)

## Vehicle Routing

In many applications we must consider hours of service regulations when optimising vehicle routes

**Computational Experiments**

Problem	Nodes	Edges	Time (s)	Cost
1	10	10	0.1	100
2	20	20	0.5	200
3	30	30	1.0	300
4	40	40	2.0	400
5	50	50	3.0	500

## United States

- Rest periods must have a duration of at least 10 hours
- At most 11 hours of driving between rests
- No driving if 14 hours or more have elapsed since the end of the last rest period
- From July 2013: No driving if 8 hours or more have elapsed since the end of the last rest or break period of at least 30 minutes

## Canada

- Rest periods must have a duration of at least 8 hours
- At most 13 hours of driving between rests
- No driving if 14 hours of on-duty time are accumulated
- No driving if 16 hours or more have elapsed since the end of the last rest period
- Every day at least 10 hours of off-duty time including 2 hours of break which may be taken in blocks of no less than 30 minutes

## European Union

- Rest periods must have a duration of at least 11 hours
- At most 9 hours of driving between rests
- A break of 45 minutes must be taken after 4½ hours of driving
- Rest periods must be completed 24 hours after end of previous rest
- Breaks may be split in a first part of 15 minutes and a second part of 30 minutes
- Rests may be split in a first part of 3 hours and a second part of 9 hours
- Three times in a week a rest may be reduced to 9 hours
- Two times in a week driving between rests can be extended to 10 hours

# Australia

## (Standard Hours)

- Rest periods must have a duration of at least 7 hours
- In any period of 5½ hours a driver must not work for more than 5¼ hours
- In any period of 8 hours a driver must not work for more than 7½ hours
- In any period of 11 hours a driver must not work for more than 10 hours
- In any period of 24 hours a driver must not work for more than 12 hours
- In any period of 24 hours a driver must have a rest

# Australia

## (Basic Fatigue Management)

- Rest periods must have a duration of at least 7 hours
- In any period of 6¼ hours a driver must not work for more than 6 hours
- In any period of 9 hours a driver must not work for more than 8½ hours
- In any period of 12 hours a driver must not work for more than 11 hours
- In any period of 24 hours a driver must not work for more than 14 hours
- In any period of 24 hours a driver must have a rest

# Regulations in Road Transport

## Truck Driver Scheduling

### Problem:

Given a sequence of customer locations to be visited within given time windows, find a schedule complying with applicable hours of service regulations such that each customer is visited within the respective time window

### Solution Approach

A driver's path is scheduled in early iterations and the optimal solution is calculated in a parallel task with respect to driver's availability. The solution is then used to schedule the next driver's path.

From:

This solution can be used as follows:

CONTRACTOR'S SCHEDULE FOR DRIVER 1: [Timeline diagram showing driver availability]

Asvin Goel, Thibaut Vidal

Seminar UFPB,  
15 March 2013

## Vehicle Routing

# Truck Driver Scheduling

## Problem:

Given a sequence of customer locations to be visited within given time windows, find a schedule complying with applicable hours of service regulations such that each customer is visited within the respective time window

## Solution Approach

- All on-duty periods are scheduled as early as possible and with maximal duration
- All off-duty periods are scheduled as late as possible and with minimal duration
- Duration of off-duty periods is only increased if beneficial

### Example:

This schedule can be generated as follows:

$((\text{WORK}, 1), (\text{DRIVE}, 6), (\text{IDLE}, 1), (\text{WORK}, 1), (\text{DRIVE}, 5), (\text{REST}, 10), (\text{DRIVE}, 6), (\text{WORK}, 1))$

Maximal duration      Duration of rest is increased to avoid reaching zero

# Service regulations such that each customer is visited within the respective time window

$$t_1^{\min} = t_1^{\max}$$

$$[t_2^{\min}, t_2^{\max}]$$

$$[t_3^{\min}, t_3^{\max}]$$

# Truck Driver Scheduling

## Problem:

Given a sequence of customer locations to be visited within given time windows, find a schedule complying with applicable hours of service regulations such that each customer is visited within the respective time window

## Solution Approach

- All on-duty periods are scheduled as early as possible and with maximal duration
- All off-duty periods are scheduled as late as possible and with minimal duration
- Duration of off-duty periods is only increased if beneficial

### Example:

This schedule can be generated as follows:

$((\text{WORK}, 1), (\text{DRIVE}, 6), (\text{IDLE}, 1), (\text{WORK}, 1), (\text{DRIVE}, 5), (\text{REST}, 10), (\text{DRIVE}, 6), (\text{REST}, 2), (\text{WORK}, 1))$

Maximal duration      Duration of REST is increased to avoid reaching zero

# Solution Approach

- All on-duty periods are scheduled as early as possible and with maximal duration
- All off-duty periods are scheduled as late as possible and with minimal duration
- Duration of off-duty periods is only increased if beneficial

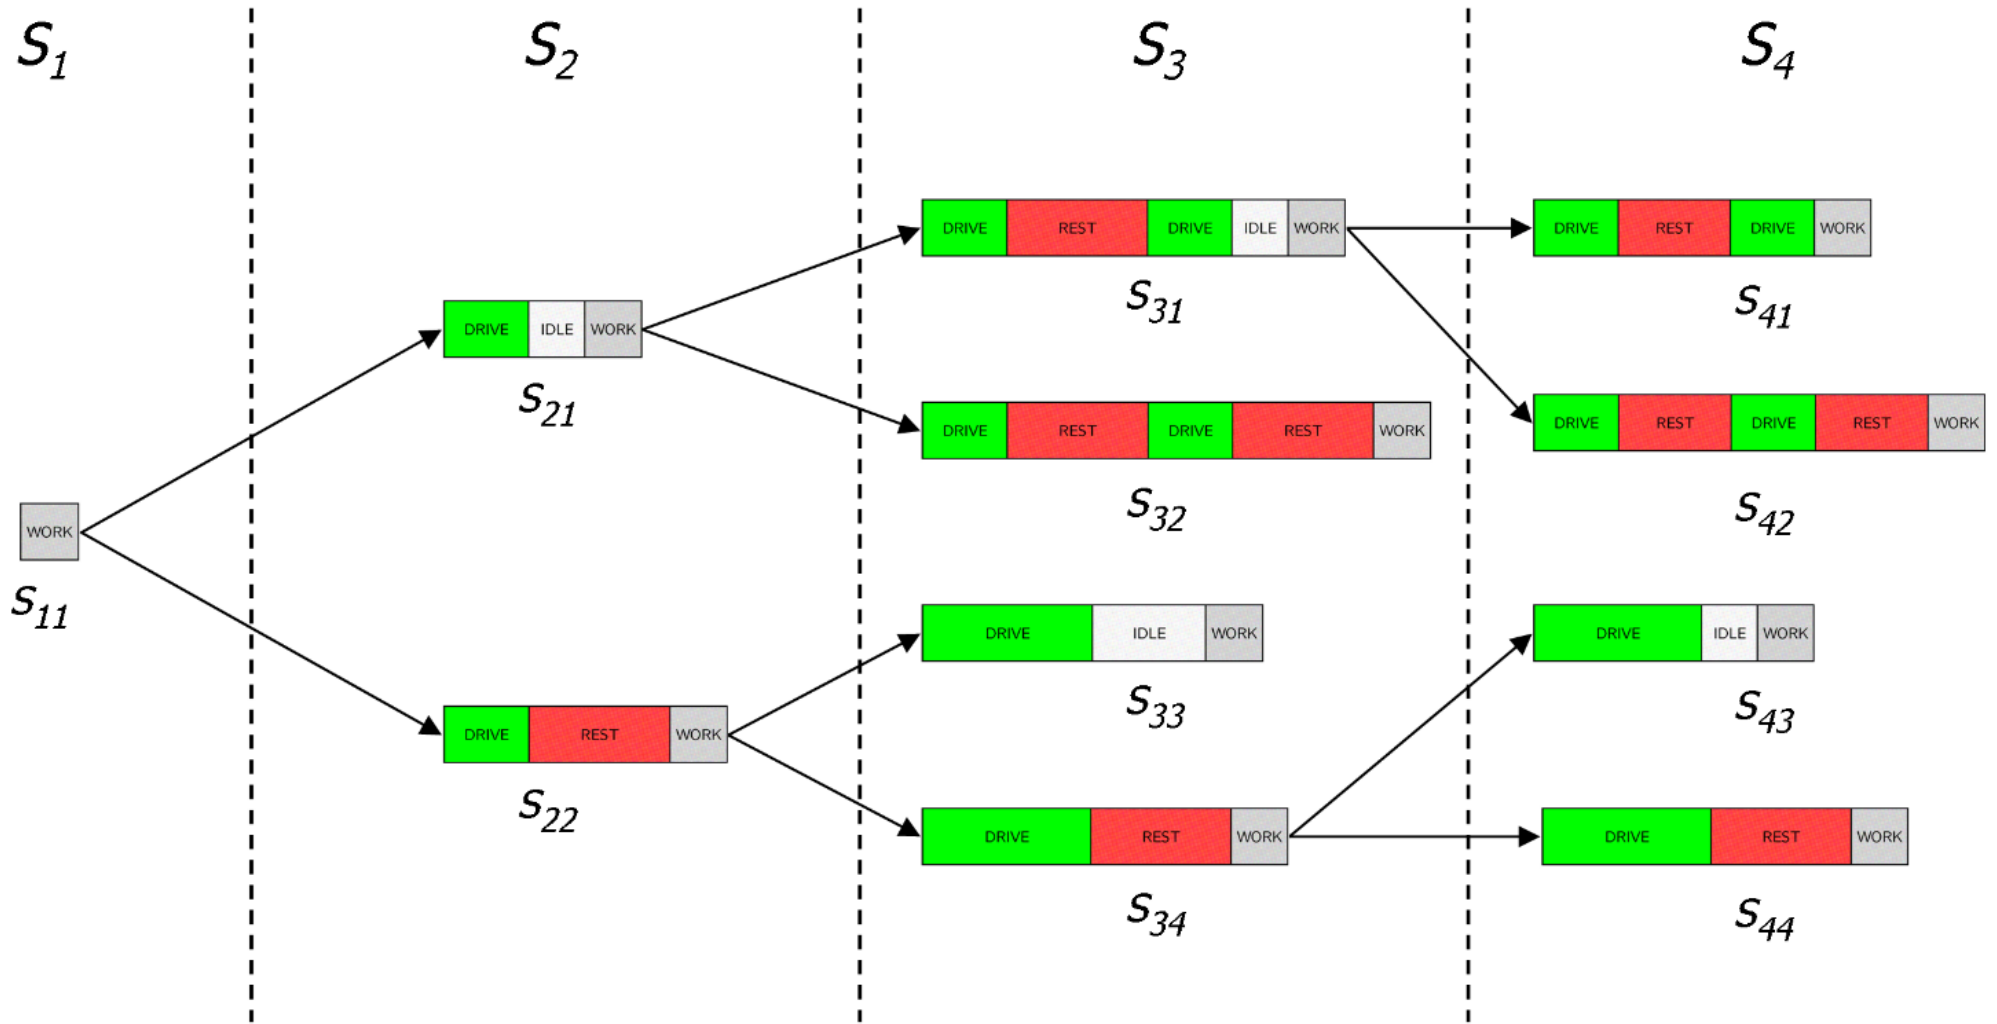

## Example:

This schedule can be generated as follows:

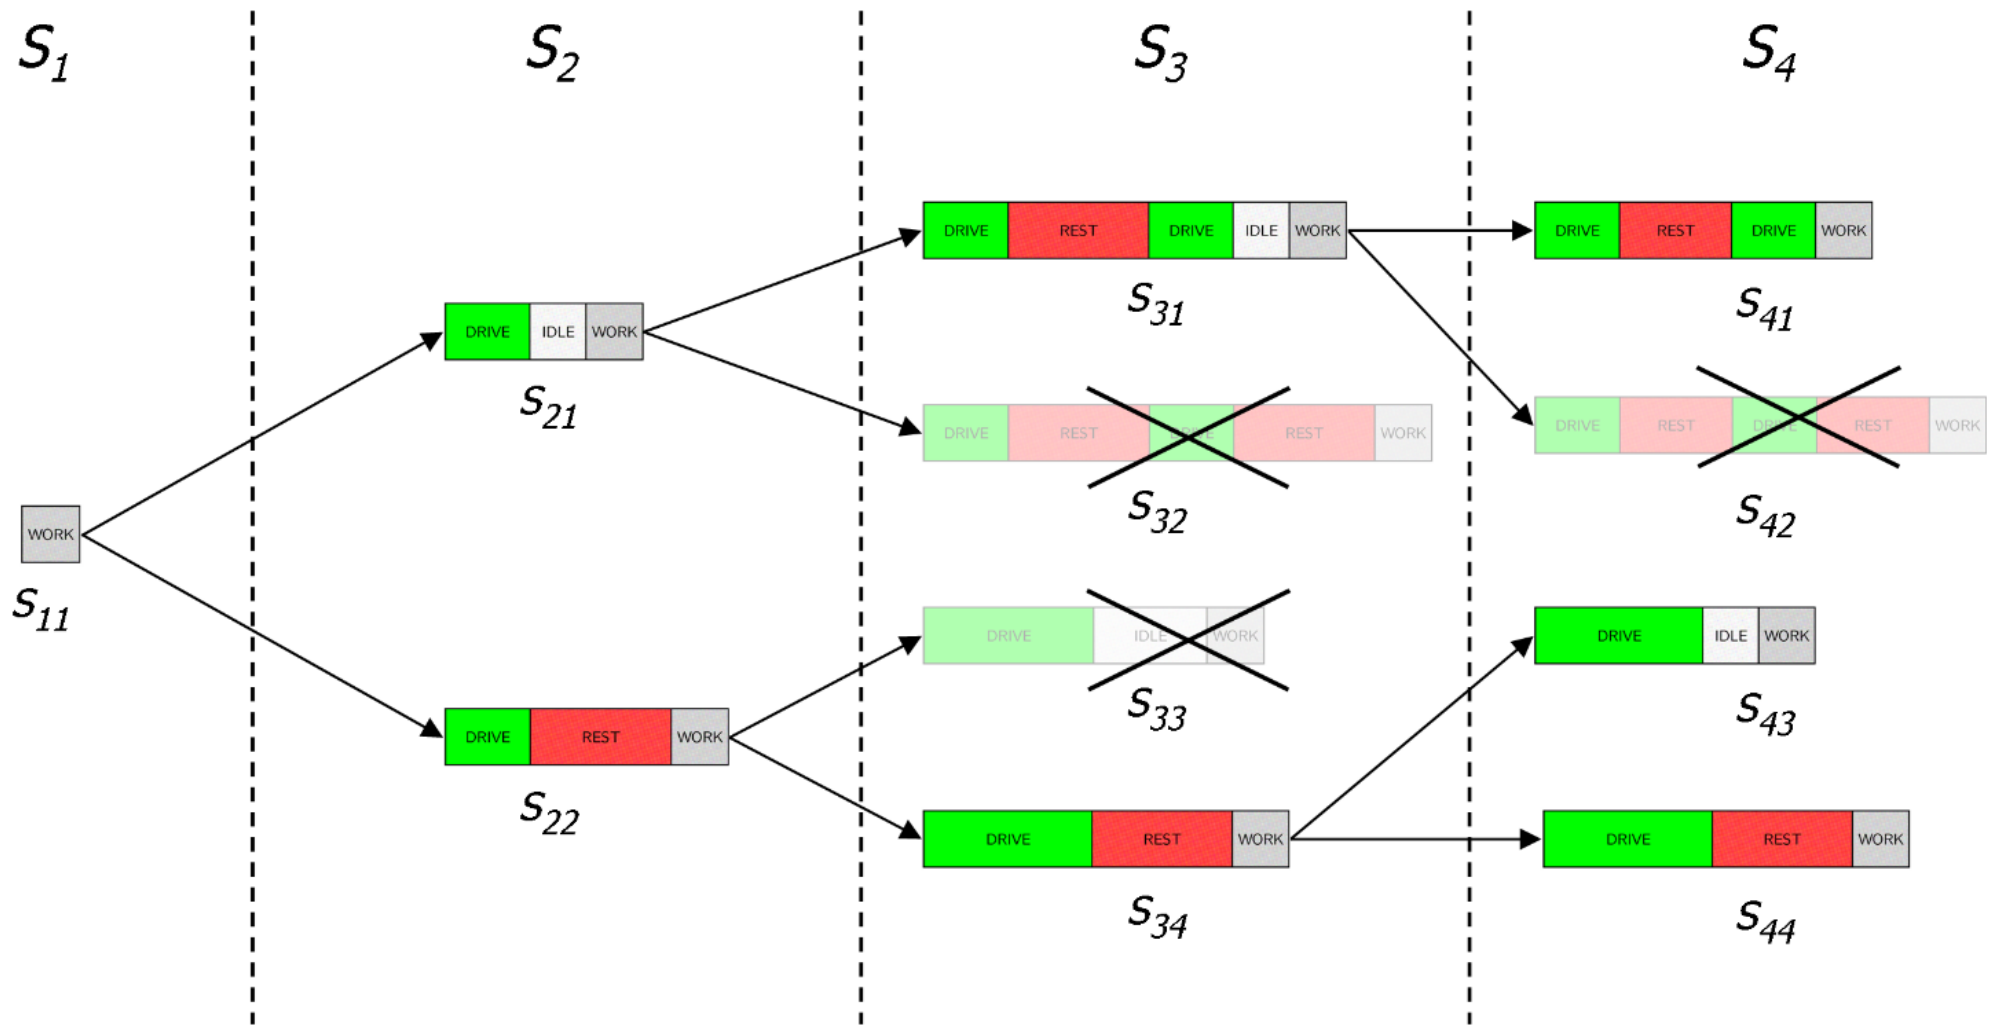

$$((\text{WORK}, 1).(\text{DRIVE}, 6).(\text{IDLE}, 1).(\text{WORK}, 1).(\text{DRIVE}, 5).(\underbrace{\text{REST}, 10}_{\text{Minimal duration}}).(\text{DRIVE}, 6) \leftarrow \underbrace{\overset{\{\text{REST}\}}{2}}_{\text{Duration of rest is increased to avoid waiting time}}).(\text{WORK}, 1)).$$

# Tree Search

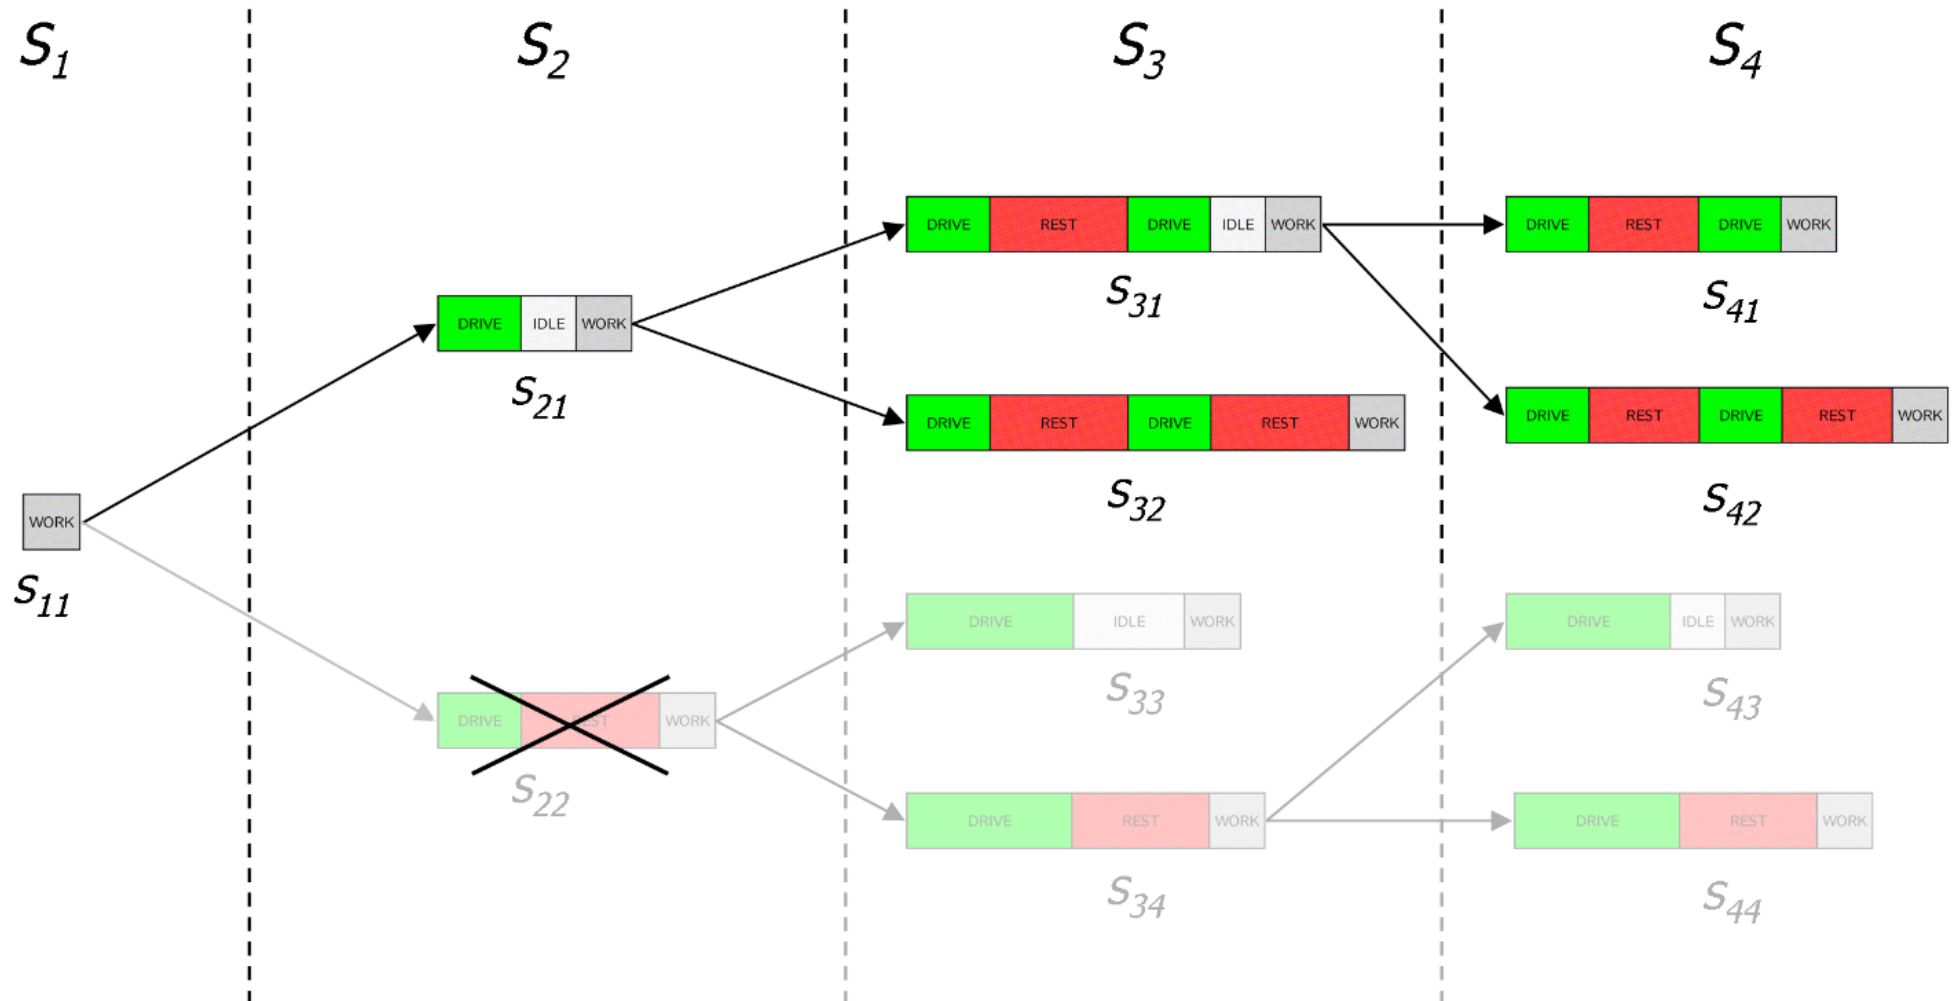

# Removal of dominated schedules

# Heuristic removal of schedules

# Truck Driver Scheduling

## Problem:

Given a sequence of customer locations to be visited within given time windows, find a schedule complying with applicable hours of service regulations such that each customer is visited within the respective time window

## Solution Approach

- All on-duty periods are scheduled as early as possible and with maximal duration
- All off-duty periods are scheduled as late as possible and with minimal duration
- Duration of off-duty periods is only increased if beneficial

### Example:

This schedule can be generated as follows:

$((\text{WORK}, 1), (\text{DRIVE}, 6), (\text{IDLE}, 1), (\text{WORK}, 1), (\text{DRIVE}, 5), (\text{REST}, 10), (\text{DRIVE}, 6), (\text{WORK}, 1))$

Maximal duration      Duration of rest is increased to avoid reaching zero

# Vehicle Routing

In many applications we must consider hours of service regulations when optimising vehicle routes

## Hybrid Genetic Search

## Computational Experiments

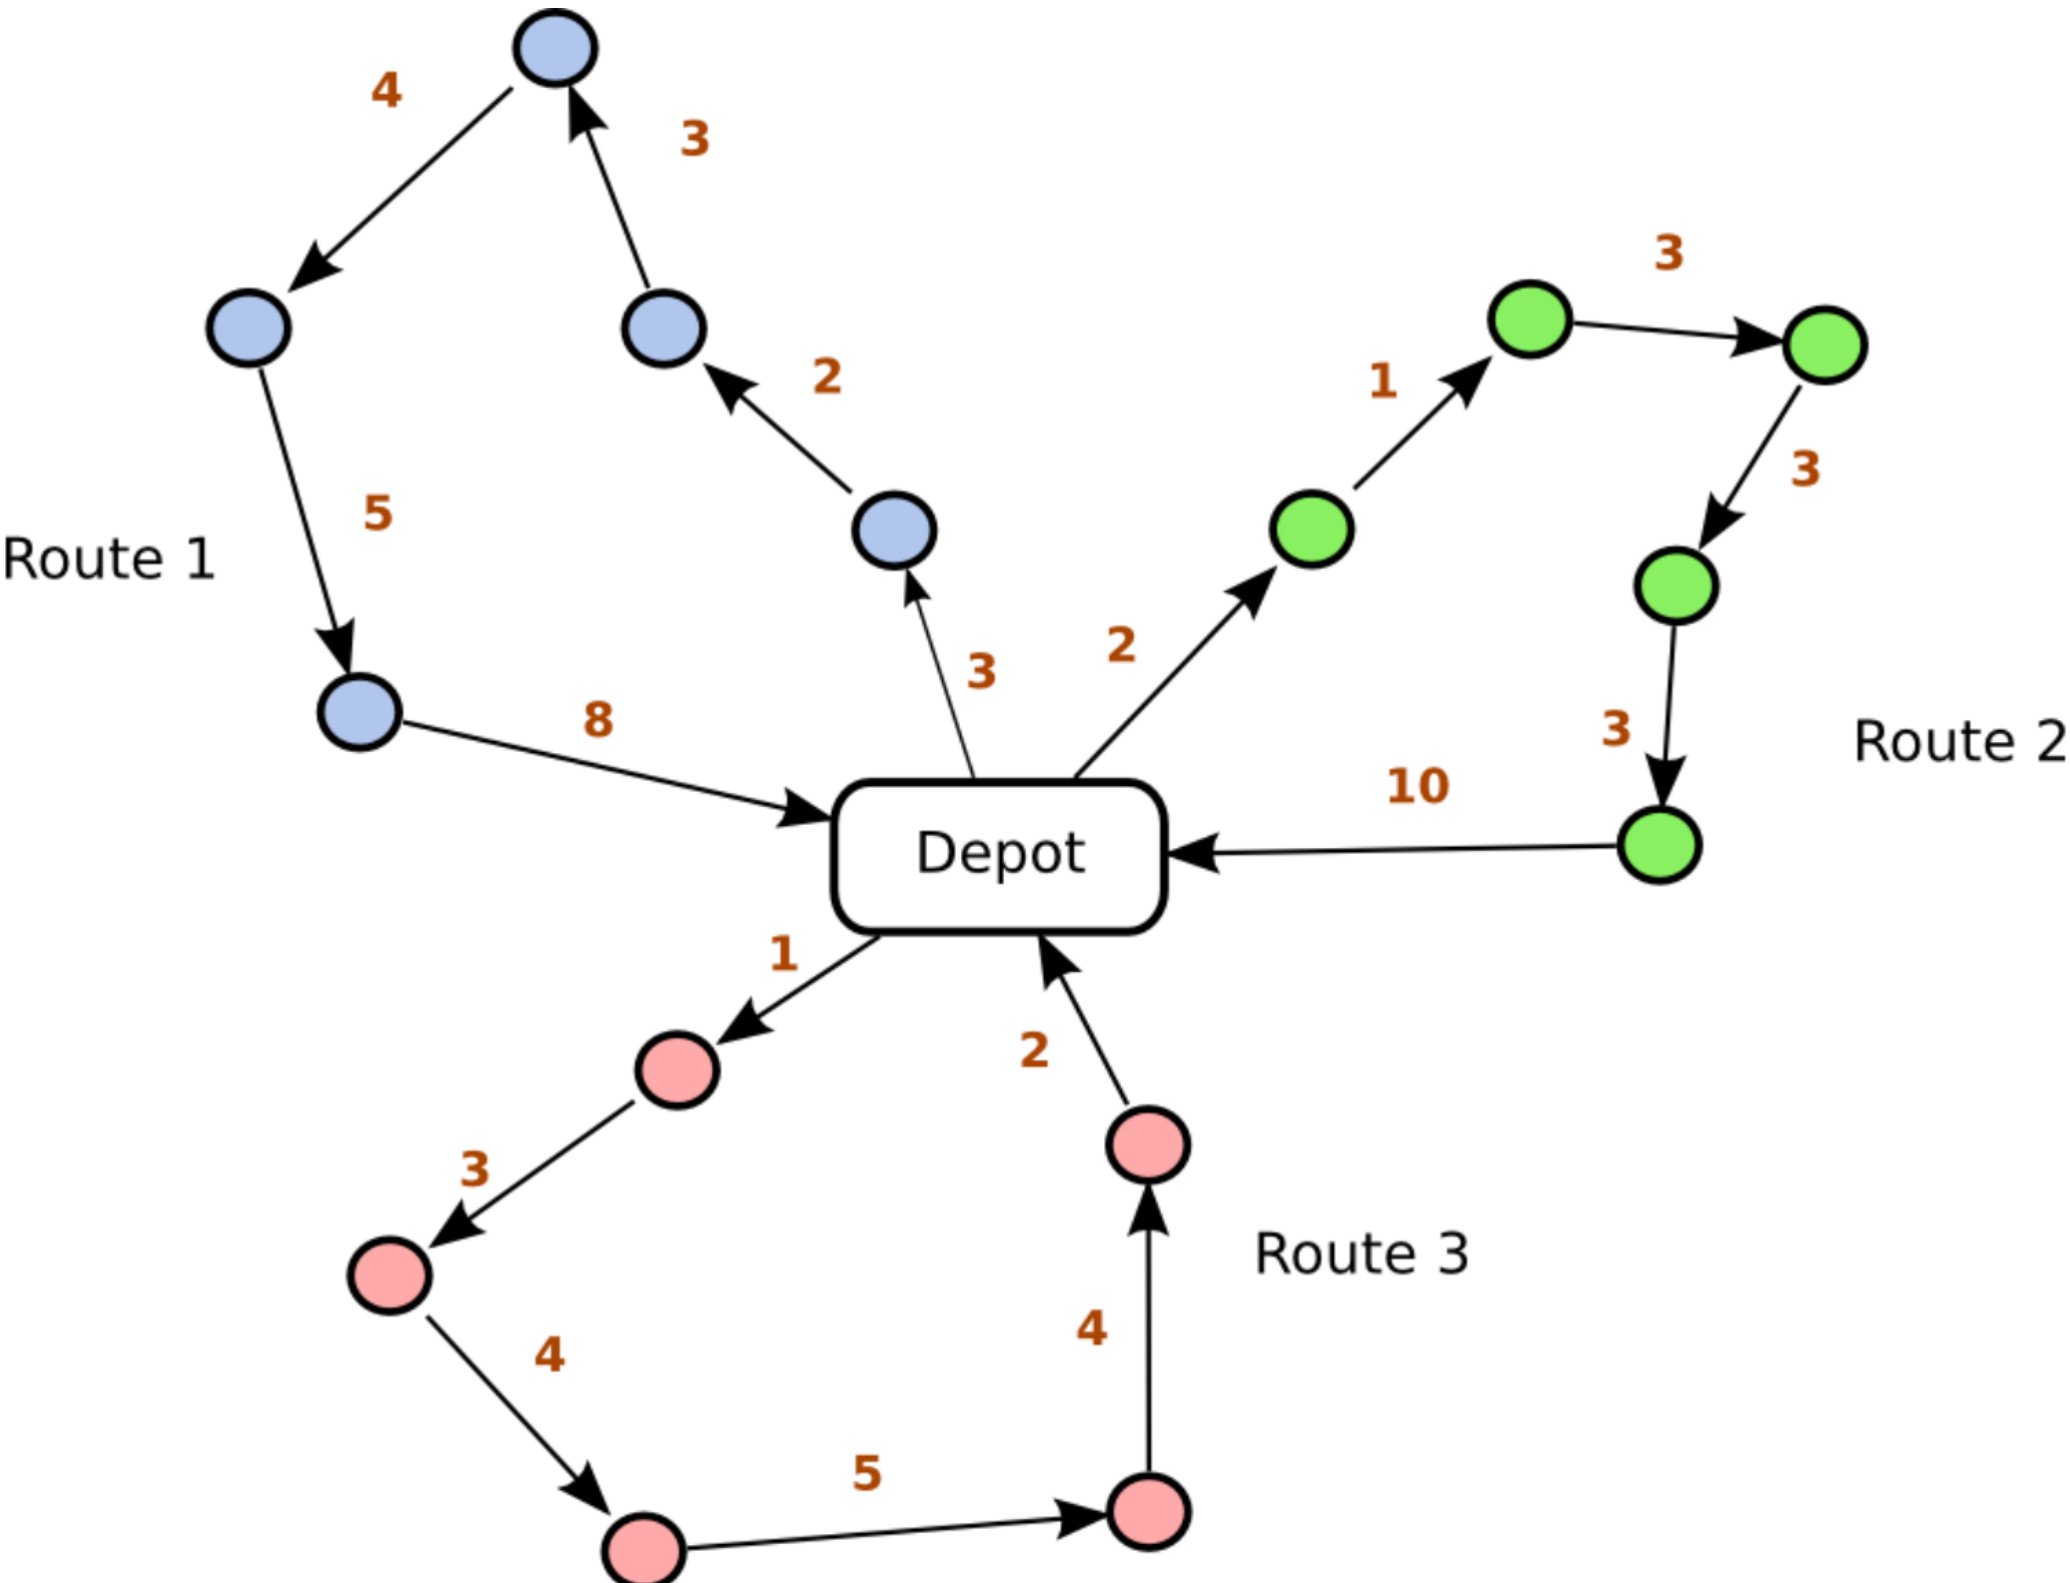

- Tested on 56 instances based on well-known VRPTW instances by Solomon
- Compared with best-known solutions for European Union regulations

# Hybrid Genetic Search

# Population

## Survival of the fittest

- Individuals are represented as giant tours without trip delimiters
- Fitness value is based on (penalised) costs and diversity

# Reproduction

Binary tournament

**Parents**

Ordered crossover

**Offspring**

# Education

## Change of representation

## Evaluation of routes

- Distance (straight forward)
- Penalised capacity violations (straight forward)
- Penalised lateness
  - Hours of service regulations must be complied with
  - If a customer cannot be visited within time windows only those schedules with minimal delay are kept
  - For some regulations heuristic scheduling methods are used to reduce computational effort

# Change of representation

INDIVIDUAL REPRESENTATION

SPLIT : *Placement of depot visits*

REMOVAL of depot visits

SOLUTION REPRESENTATION

# Evaluation of routes

# Regulatory Impact Analysis

- We assume that carrier seeks to minimise total costs
- Optimise routes for different regulations using hybrid genetic search
- Analyse solutions regarding total costs and road safety
- Fatigue/Risk Index Calculator provided by Health and Safety Executive - UK (<http://www.hse.gov.uk/research/rrhtm/rr446.htm>)

# Hours of Service Regulations in Road Transport

## Fatigue

Truck driver fatigue is internationally recognised as a significant factor in 15-20% of all commercial road transport crashes

To improve road safety governments world wide are adopting stricter hours of service regulations for truck drivers

Some regulations introduce a "chain of responsibility" so that dispatchers can be made liable for unrealistic schedules

## Truck Driver Scheduling

**Problem:**  
Given a sequence of customer locations to be visited within given time windows, find a schedule complying with applicable hours of service regulations such that each customer is visited within the respective time window

## Regulatory Impact Analysis

- We assume that carrier seeks to minimise total costs
- Optimise routes for different regulations using hybrid genetic search
- Analyse solutions regarding total costs and road safety
- Fatigue/Risk Index Calculator provided by Health and Safety Executive - UK (<http://www.hse.gov.uk/research/rrhtm/rr446.htm>)

## Vehicle Routing

In many applications we must consider hours of service regulations when optimising vehicle routes

**Computational Experiments**

Problem	Genetic Search	Local Search	Hybrid Search
1	100	100	100
2	100	100	100
3	100	100	100
4	100	100	100
5	100	100	100
6	100	100	100
7	100	100	100
8	100	100	100
9	100	100	100
10	100	100	100

Asvin Goel, Thibaut Vidal

Seminar UFPB,  
15 March 2013
